The silicon window can be divided into two types: coated and uncoated. It is processed according to the customer's requirements, and it is suitable for the near-infrared band in the 1.2-8 μ m region. Because silicon material has the characteristics of low density (its density is half of germanium material or zinc selenide material), it is especially suitable for some occasions sensitive to weight requirements, especially in the application of 3-5 μ m band.
