Abstracts

Wafer polishing is a silicon wafer finishing process used to create a stronger, thinner, and more flexible silicon wafers. The wafer polishing process creates thinner wafers than backgrinding alone, and removes stresses and prevents warping that causes wafers to weaken. Post backgrind relief also prepares silicon wafers for dicing and is ideal for electronic applications requiring flexible circuits. Silicon Wafer Polishing Pads is a product which increases semiconductor integration by smoothening the semiconductor wafer surface through physical and chemical polishing processes.
