## Abstracts

The single-crystal superalloys are often classified into first, second and third generation alloys. The second and third generations contain about 3 wt% and 6wt% of rhenium respectively. Rhenium is a very expensive addition but leads to an improvement in the creep strength and fatigue resistance. It is argued that some of the enhanced resistance to creep comes from the promotion of rafting by rhenium, which partitions into the  $\gamma$  and makes the lattice misfit more negative. Atomic resolution experiments have shown that the Re occurs as clusters in the  $\gamma$  phase. It is also claimed that rhenium reduces the overall diffusion rate in nickel based superalloys.
