Abstracts

Ski boots are designed to transfer your movements into your skis, while supporting and protecting your feet, ankles, and lower legs. In order for the boots to transfer forces well, they have to be stiff and restrict the movement in your ankles. This stiffness and lack of movement makes it a lot harder to walk in ski boots than normal shoes. Also, because ski boots are stiff, tight, and restricting, this can make badly fitted ski boots very uncomfortable. It is important to find the right boot for you and to have the ski boots fitted properly. Even good fitting ski boots can be uncomfortable if you haven't used them recently, because of the pressure they put on your feet and legs.
