Abstracts

Small molecule drugs are important and efficient components in biological/drug combinations. Small molecules have some considerable advantages over large ones. They can be designed to provide powerful therapeutic effects in small doses, usually less than 10 milligrams or even micrograms. Combined with the sophistication of chemical manufacturing technologies, a smaller number of APIs usually translates into lower commodity costs relative to the efficacy of macromolecular therapies. Small molecule drugs have a large amount of expertise and experience in the formulation of highly controlled formulations that can be delivered to specific locations and released over specific periods of time.
