Abstracts

Finger vein recognition technology is a new biometric recognition technology, which uses the vein distribution image in the finger to identify. The working principle is based on the fact that the blood flowing in human fingers can absorb the light of specific wavelength, and the clear image of finger vein can be obtained by irradiating the finger with the light of specific wavelength. Using this inherent scientific feature, the acquired image will be analyzed and processed to obtain the biological characteristics of finger vein, and then the obtained finger vein feature information will be compared with the previously registered finger vein features to confirm the identity of the login.

The finger vein lock uses the vein blood vessel image in each person's finger as the key to open the door after recognition.
