Abstracts

When solar panels work, they are generally connected in series, and the panels are connected in series to form a photovoltaic array, which finally forms a power station system. However, due to current technology and manufacturing factors, the current and voltage output characteristics of each board are inconsistent and will become more and more obvious over time. The intelligent control chip module is designed and installed in the intelligent junction box. Through the control module, remote data monitoring of the basic state of the assembly can be carried out, data such as current, voltage and temperature can be monitored in real time, and it is also possible to realize whether each board in the battery panel array is correct or not. Power optimization and efficiency improvement.
