Abstracts

Smart tattoo is a new type of medical sensor that can be hidden under painted tattoos and monitor your metabolism and fatigue by measuring changes in your skin's pH. By using different sensing materials, the tattoo can also be used to detect other components in sweat, such as sodium, potassium or magnesium. It is a speculative application of flexible electronic products. Digital tattoos can be implanted or imprinted on the hand, allowing the wearer to exchange information simply by touching it like a handshake. Tattoos will use the body's electrochemical energy to remain permanently activated and allow users to activate the technology just by touching. For example, just touch the door to unlock it and hold the credit card to use it. It can also more effectively measure the body's electrical activity, and it can assess physical movement to distinguish between different forms of social interaction expressed through the hand.
