Abstracts

Key growth drivers for the software-defined peripheral market include the growing demand for policy-based security architectures that reduce network complexity, and the growing demand for cloud-based applications. According to the deployment model, software-defined peripheral markets are divided into cloud and local. Cloud systems can make better use of technology and easily share infrastructure between multiple users and offices, providing a higher level of scalability and reducing ongoing costs for implementation and continuous development. These benefits are expected to drive cloud software-defined perimeter solutions for all user types. As more and more applications are deployed on the cloud, traditional on-premise security solutions across large and small and medium-sized enterprises have transformed into cloud-based security solutions.
