## Abstracts

There are two types of encrypted USB flash drives: hardware encryption and software encryption. Both require authentication like a key, password or biometric solution to access the data stored on the drive, but they each have their own unique characteristics.

Software encryption is the cheaper of the two options. The drive's encryption relies on software that comes either from security software downloaded onto the host computer or through software included with the computer's operating system (BitLocker is used by Windows). The encryption key is usually just a password. However, the security of the encryption relies on the security of the computer.

The software sometimes needs patches or updates; if that's not done, the software is vulnerable to hackers. It's also prone to error and requires that users follow precise steps for the encryption to work. Also, you may be limited to use on certain computers that have the encryption software making it difficult to transfer data to and from any device. Software encryption is better than no encryption, but for anyone using a flash drive for very sensitive data, it should be used as a fallback option. This report studies the Software Encrypted Flash Drives market.
