Abstracts

Solder is a fusible metal alloy used to create a permanent bond between metal workpieces. Traditional solder that used to be used for soldering in the In-car Application used to be a mixture of tin and lead. Different types of solder are used for different purposes. With the drive to reduce the amount of lead being used for environmental and health reasons, lead free solder is now being widely used. A European Directive mandates that solder containing lead shall not be used commercially. This means that for any soldering to be undertaken by the hobbyist the traditional solder containing lead will not be available.
