Abstracts

Soldering-type conductive paste, also known as power compound grease, is a new type of electrical material, which can be used for the contact surface of power connectors, and has significant effects of reducing resistance, anti-corrosion and power saving. Our country has been developing and producing since the 1980s. There are dozens of varieties and models, and their basic performance is the same. Mineral oil, synthetic lipid oil, and silicone oil are used as base oils, and special additives such as electrical conductivity, anti-oxidation, anti-corrosion, and arc suppression are added. Soft paste made by grinding, dispersing, modifying and refining. Conductive adhesives are typically heat-cured epoxy or UV-cured acrylate adhesives, with the addition of metallic fillers, such as silver, to achieve conductivity. Adhesive conductive adhesives are often used as a more effective alternative to traditional bonding. Since adhesive conductive adhesives cure at significantly lower temperatures than solder, this adhesive is ideal for making conductive connections in heat-sensitive materials. In addition, such glues are more flexible than solder and therefore better resistant to vibration. Compared with solder, the advantage of adhesive conductive adhesive is that it is lead-free and solvent-free.
