Abstracts

Solid Formulations are a solid body drug delivery system of various weights and shapes, adapted for introduction into orifices of the human body.⁴ The external membrane of the suppository will typically melt, soften, or dissolve at body temperature which allows the active ingredient to then be absorbed by the surrounding tissue. Suppository bases usually employed are cocoa butter, glycerinated gelatin, hydrogenated vegetable oils, mixtures of polyethylene glycols of various molecular weights, and fatty acid esters of polyethylene glycol. The suppository base employed has a marked influence on the release of the active ingredient incorporated in it.
