Abstracts

Soluble dietary fibers are defined as the fibers that display dispersibility in water to create a gel-like material. These fibers produce viscous gels in the gastrointestinal tract and possess the capability to slow down the process of passing food from the stomach to the intestine. Such type of fibers is significantly sourced out from fruits and vegetables, legumes, and oats.

Soluble dietary fibers are used as an additive to foods, and they also promote the colonic health, along with bifidobacterial or lactobacillus stimulation in the gut, coronary artery health, lowers cholesterol, and glucose metabolism. Moreover, soluble dietary fibers contribute to weight management and reduce the risk of cardiovascular diseases. Water-soluble dietary fiber is considered as one of the significant forms of dietary fibers. It is composed of inulin, beta-glucan, polydextrose, pectin, fructooligosaccharides, galactooligosaccharides, and corn fiber, which helps promote the nutritional profile of the food and beverage product added.
