Abstracts

Sound power is the sound energy emitted by a sound source in a unit time. By measuring the sound power, the acoustic characteristics of the sound source can be evaluated. When sound power is used for evaluation, it is usually expressed as the logarithmic sound power level of the ratio of the measured value to the reference value.

The necessity of sound power level measurement has been recognized by some European countries a long time ago. Enterprises exporting European products (such as office machines, home appliances, etc.) have successively adopted the sound power level to evaluate their products. Now, companies such as construction machinery and general-purpose engines also tend to introduce sound power level evaluation methods.
