Abstracts

Monomers are the building blocks of all polymers. They are molecules that combine with the same molecule to form a polymer. Special monomers are different from commercial monomers and these differences give them important new polymer properties. The most important performance of a special monomer is its built-in function. This functionality provides a great opportunity to customize the functional design of the polymer to meet specific physical, chemical and performance requirements. Commercial units do not provide the customizations needed for most modern high-tech applications. They are used in a variety of applications in the automotive, paint and coatings, adhesives, pulp and paper, water treatment and personal care industries.
