Abstracts

Spectrum therapy instrument irradiates the human body/cavity surface with a spectrum range of 0.4-3.6 μ m, and can effectively kill tumor cells, coagulate mucosal tissues, and coagulate and occlude blood vessels through the combined effect of light and heat to achieve the purpose of healing. The therapeutic mechanism is to produce a photochemical effect on an organism, so that it has important biological effects and therapeutic effects. The absorption of red light by mitochondria is the largest in cells. After red light irradiation, the catalase activity of mitochondria increases, which can increase the cell's metabolism; increase the glycogen content, increase protein synthesis, and increase adenosine triphosphate decomposition. What's more, the beam light could promote the healing of wounds and ulcers; also increase the phagocytosis of white blood cells and improve the body's immune function.
