Abstracts

Spinal surgery has evolved dramatically over the years as advances in technology have made it possible to improve surgical techniques. Spinal surgery involves the modification of the affected area of the back bones and nerves. The implantation of one or more screws or components is a very delicate surgery. The robot can achieve better precision than can a skilled surgeon. Robotic procedures offer significant cost savings in terms of pre- and post-operation care costs and length of stay at hospitals. Technological advances and breakthroughs leverage new materials and new sensor configurations. Sophisticated software is further evolving product implementation: Clinically efficient solutions, Clinically less complex surgery, Shorter length of stay, Minimally invasive surgery, Financially lower cost and Operationally more simple.
