## Abstracts

Square (profile rails) are flat on the top and bottom, while the sides have a concave shape with ball-conforming races where bearings roll. They typically target applications such as machine tools that require high load capacity, stiffness, and accuracy. A profile rail's performance comes from its inherent shape and through precise grinding of the rail ball tracks. The raceway on which the balls ride in the rail and carriage is only slightly larger in radius than the balls themselves. This geometry cradles the balls as they flatten slightly under load, which expands the contact area between them and the raceway and results in higher load capacity. Substituting cylindrical rollers for ball bearings can roughly double load capacity in a same sized package.
