Abstracts

Starch is a major reserve carbohydrate of higher plants and occurs in the form of water-insoluble granules. It is a heterogeneous polysaccharide composed of two high molecular weight entities called amylose and amylopectin. These two polymers have different structures and physical properties. The agricultural biomass containing starch can be used as a potent substrate for production of various important bioactive compounds or products like liquid or gaseous fuels, feed proteins and chemicals by using corn, wheat, oats, rice, potato, and cassava as the important substrates. Starch as an important constituent of human diet, can also be used chemically and enzymatically processed into a variety of different products such as starch hydrolysates, glucose syrups, fructose, maltodextrin derivatives or cyclodextrins, used in food industry. Some of the enzymes used in starch hydrolysis include α -amylase, β -amylase, amyloglucosidase, pullulanase, and glucose isomerase.
