Abstracts

Gowns are examples of personal protective equipment used in health care settings. They are used to protect the wearer from the spread of infection or illness if the wearer comes in contact with potentially infectious liquid and solid material. They may also be used to help prevent the gown wearer from contaminating vulnerable patients, such as those with weakened immune systems. Gowns are one part of an infection-control strategy. Sterile surgical gown prevents cross-contamination and cross-infection and is individually sterile packed.
