## Abstracts

Structural glass is glass which has gone through a manufacturing process to enable it to be used for structural elements of buildings. The resulting product enables walls, floors and ceilings in buildings to be transparent and can even be load bearing.

Structural glazing is a system of bonding glass to a building's structural framing members utilizing a high strength, high performance silicone sealant specifically designed and tested for structural glazing. In structural glazing applications, dynamic wind loads are transferred from the glass, by the structural silicone sealant, to the perimeter structural support. The net results of this glazing technique are either four-sided systems, which yield an unobstructed glass surface; or two-sided systems, where horizontal or vertical accents can be achieved.
