Abstracts

The production of oil and natural gas is a complex endeavor. Crude oil and natural gas are organic mixtures with sometimes widely varying composition depending on their deposits. The standard components of crude oil include hydrocarbons and sulphur, oxygen and nitrogen compounds. Natural gas consists of such gases as methane, ethane and propane and likewise contains other secondary constituents such as sulphuric acid. Resistance to pitting, crevice and stress corrosion is therefore one of the most important characteristics of materials used in the oil and gas production.
