Abstracts

Green mining is defined as technologies, best practices and mine processes that are implemented as a means to reduce the environmental impacts associated with the extraction and processing of metals and minerals. Surface mining has higher productivity, which lowers the costs; in the case of underground mining, the equipment for maintaining productivity is more expensive as compared to the open pit equipment. Moreover, open pit provides a large production scale, and the share of open pit mines have also offered the opportunity for manufacturing open pit equipment in large number that further decreases the production costs. A lot of surface mines operate for 24 hours a day and almost around 365 days a year to put the pit machinery for as many hours as possible, which in turn decreases the number of equipment required.
