## Abstracts

Survey grade receivers are designed for the achievement of consistent network accuracy in the static or real-time mode. Positions determined by these receivers will generally provide the best accuracy of the categories listed. The components of these receivers can usually be configured in a variety of ways. The receivers are typically dual frequency, code and carrier receivers. Many are GNSS receivers (GPS+GLONASS). They generally provide more options for setting the observational parameters than recreational or mapping receivers. Surveying receivers are typically capable of observing the civilian code and carrier phase of all frequencies and are appropriate for collecting positions on long base lines. Survey grade receivers are capable of producing network accuracies of better than 1m with real-time differential correction and better than 0.1m with post-processing.
