## Abstracts

The immune system responds by producing antibodies that destroy the infectious agents, usually in co-operation with specialised body cells or by neutralising the toxins that are responsible for the disease. This process of stimulating immunity is called vaccination.

Vaccines contain antigens from viruses, bacteria, bacterial toxins, or parasites. They are given to pigs, usually by injection, to stimulate an immune response which will protect the pigs against later natural infection with the organism from which the vaccine was derived. Most stimulate both a humoral response and a cell-mediated response. Vaccines can either contain viable organisms that will multiply in the pig, or inactivated ones that will not multiply in the pig.

This report contains market size and forecasts of Swine Vaccines in Brazil, including the following market information:
