Abstracts

SWIR imaging cameras cover the wavelength range from 900nm to 1700nm. SWIR is similar to visible light in that photons are reflected or absorbed by objects, providing the strong contrast needed for higher resolution imaging. A large number of applications that are difficult or impossible to perform using visible light have achieved great results using short-wave infrared (SWIR) imaging. Shortwave Infrared Imaging (SWIR) is an advanced technology used to generate images from radiation in regions of the electromagnetic spectrum that are invisible to the naked eye. At the same time, short-wave infrared imaging cameras can image through glass.
