Abstracts

One of the main factors for feed in poultry production is cost. Therefore, reducing feed costs per chicken is a top priority. Poultry production must be efficient because feed must be converted into meat and eggs. Feed costs can be reduced by adding feed additives such as enzymes and antioxidants. These additives can increase digestibility and prevent nutrient loss, thereby allowing poultry to obtain more nutritional value from the same amount of feed. Synthetic antioxidants are usually produced in the form of pure substances with a consistent composition and used in the form of clearly defined mixtures with the pure substances. Higher stability, availability and lower production costs have driven the growth of the synthetic segment in the feed antioxidant market. It also protects fat-soluble vitamins and other nutrients from oxidative degradation and loss of active ingredients in the feed.
