## Abstracts

In cancers, where mutations have led to the loss of function of one gene, using a drug molecule that specifically targets the corresponding gene of the synlet pair has been demonstrated to be a viable and effective therapeutic regimen. Recent advances in biomarker research, including the development of companion diagnostics, in combination with modern molecular screening platforms, which include clustered regularly interspaced short palindromic repeats (CRISPR)- and RNA interference (RNAi)-based screening techniques, have led to the identification of a number of synthetically lethal gene pairs.
