Abstracts

Operating in the band between 30 and 300 MHz, VHF radios are typically smaller, lighter and more portable than their HF counterparts. This makes them particularly useful for smaller units in the field communicating with one another. VHF waves travel across the Earth's surface and do not reflect off the ionosphere. As such, they are limited to line-of-sight (LOS) transmissions - the antennas of the transmitting and receiving radios must be able to 'see' one another. Given this limitation, VHF is generally limited to ranges of approximately 8 kilometres.
