## Abstracts

Organic light-emitting diodes (OLEDs) have great application prospects in flat-panel displays and solid-state lighting. As the third-generation OLEDs, TADF materials have a maximum exciton utilization rate of 100%, which has attracted extensive attention in the industry. At present, TADF-based OLEDs have achieved high external quantum efficiency, but like phosphorescent OLEDs, most of the TADF molecules need to be doped in the host material.
