Abstracts

A thin film transistor (TFT) is a distinct class of field-effect transistor (FET) produced by depositing thin-films of an active semi-conductor layer along with the dielectric layer & metallic connections over a supporting substrate. It is also a type of flat-panel LCD display screen, in which each pixel is controlled by one to four transistors. This transistor could be made using an extensive variety of semi-conductor materials where a popular material is silicon. Transistors are embedded inside the panel itself, lessening crosstalk between pixels & improving image stability. The primary application of thin film transistors is within TFT LCDs, an implementation of liquid crystal display technology.
