Abstracts

Tidal steam generators (TSGs) make use of moving water to power turbines. The turbines of the generator are placed under water by different mechanism to hold at a position. TSGs come in different designs like horizontal axis turbine, vertical axis turbine, hydrofoil, closed tips, and others. These TSGs are used to harness the wave and tidal energy from the oceans or other major water resources. Owing to limited availability of conventional fuels such as oil, gas, and coal along with associated pollution releases by conventional sources many countries are investing in clean energy sources that includes wave and tidal energy and hence the market for this generated is expected to grow in the upcoming times. Advanced technology and intermittent nature of tidal energy are the major restraints in this market. Moreover, the risk of marine mammals and fish being struck by tidal turbine blades is another factor restraining the growth of the market.
