Abstracts

A tiltrotator can best be described as a wrist between the arm of the excavator and bucket, (or whatever other tool is fitted to the tiltrotator's quick coupler). With its integral quick coupler and rotary swivel, the tiltrotator can also use extra hydraulic functions to power and manipulate other worktools below it such as a breaker, grapple or an auger, which can be attached to the quickcoupler on the tiltrotator, for simplified attachment mounting, dramatically increasing the excavator's utilization on the jobsite.

Tiltrotators are mounted on the construction excavators for quick installation of excavator accessories, such as bucket and hydraulic clamp, allowing them to automatically rotate and work faster and more efficient.
