Abstracts

Epilepsy is a group of neurological disorders characterized by brief, involuntary episodes of vigorous shaking of a part or complete body. The patient may experience loss or disturbance of consciousness and movements along with sensory or psychiatric disturbances. Grand mal seizures or tonic-clonic seizures are a type of generalized seizures, which affect the entire brain and are the most common type of epileptic seizures. Grand mal seizures are caused by neurotransmitter imbalances, which can also be influenced by fatigue, lack of sleep, hypertension, stress, intense lighting, rapid motion, blood sugar level, anxiety, etc. The grand mal seizures consist of two phases, the tonic phase and the clonic phase. The tonic phase involves loss of consciousness and muscle twitching and the phase usually last only for a few seconds. The clonic phase consists of rapid muscle contraction and relaxation resulting in convulsions.
