Abstracts

Topical antibiotics pharmaceuticals are used to treat infections of the skin and are commonly applied as creams and ointments. Antibiotics are agents that destroy or inhibit the growth of microorganisms, which are sensitive to them. Few topical antibiotics are sold without prescription from physicians and are available in several forms such as ointments, creams, sprays and powders. Topical antibiotics prevents infection caused by bacteria which get into minor scrapes, burns, and cuts. Treating minor injuries with antibiotics allows faster healing. If the injuries are left untreated, the bacteria will multiply and create redness, itching, swelling, oozing, and causing pain. Untreated infections can ultimately spread and become more serious. Soft tissue and dermal bacterial infections are one of the most commonly occurring conditions amongst people accounting for over 25 million visits to physicians every year. Most of these infections are minor and chronic in nature causing irritation and can be treated as outpatient procedures. Topical antibiotics are a large generic group of pharmaceutical products catering to the treatment of these commonly occurring conditions. A large variety of bacteria such as Staph aureus, Streptococcus viridians, Enterococcus faecalis and Staph pyogenes are responsible for these infections.
