Abstracts

TMVR, also known as transcatheter mitral valve replacement is a way of replacing the mitral valve in the heart without the need for conventional open-heart surgery. TMVR transcatheter mitral valve replacement is a treatment for mitral valve stenosis (tight mitral valve) or mitral valve regurgitation (leaky mitral valve) or a mix of the two. TMVR transcatheter mitral valve replacement was developed initially as a method of replacing the mitral valve in patients considered too high risk for surgery but will likely replace mitral valve replacement surgery in the future as the technology improves and the outcomes are proved.
