Abstracts

Transdermal patches drug delivery system are a method of delivering drugs directly through the skin into the bloodstream. It mainly has polymer matrix, drug, penetration accelerator and adhesive layer. Patches can provide controlled, continuous administration of drugs that are easy to eat with minimal side effects and non-invasive. Compared to injectable and oral systems, it avoids first-pass metabolism and is easy to maintain drug concentration, ensuring that drugs reach the body with minimal side effects, ensuring good adhesion and effective release through the skin in the form of skin circulation for hours or days.
