Abstracts

Transient elastography equipment is a medical equipment used in transient elastography technology, which can be divided into independent equipment and mobile equipment. It consists of three key parts: a transducer that generates ultrasonic waves and ACTS as an ultrasonic receiver; a probe that emits low-frequency vibration waves on the transducer; a software program that can record and analyze data; and it is widely used in the detection of liver disease patients and internal organs. Instantaneous elasticity imaging techniques are non-invasive, painless, fast, convenient advantages of bedside and clinic examination, and the result is not dependent on the operator, has good repeatability, not only can be used in non-traumatic liver fibrosis diagnosis, can also be used to monitor the development of liver disease, can also be used to evaluate the effect of anti-fibrosis treatment.
