Chemically modified fire-retardant fibers can be produced through various techniques, and these techniques depend on the nature of the substrate fibers (synthetic or natural). For synthetic-based substrate fibers, the flame retardant materials (based on halogen, nitrogen, silicon, and phosphorous) are incorporated into polymerization during the fiber manufacturing process through melt spinning, or doped in the spinning bath during the production of fibers by solution spinning. Additionally, flame retardant finishes can be applied on the surface of natural or synthetic substrate fibers.
