Abstracts

Telematics is a combination of the words telecommunications and informatics. Telematics, in a broad sense, is any integrated use of telecommunications with information and communications technology. It is the technology of sending, receiving and storing information relating to remote objects – like vehicles – via telecommunication devices.

Truck telematics is a way of monitoring the location, movement, status and behavior of a vehicle within a fleet. This is achieved through a combination of a GPS receiver and an electronic GSM device that is installed in each vehicle, which then communicates with the user and web-based software.

Truck telematics is mainly composed of three parts: terminal (hardware), software (mobile Hardwired Install Telematics APP, Client PC) and cloud platform.
