Abstracts

A truss is an assembly of beams or other elements that creates a rigid structure. In engineering, a truss is a structure that 'consists of two-force members only, where the members are organized so that the assemblage as a whole behaves as a single object'. A 'two-force member' is a structural component where force is applied to only two points. Although this rigorous definition allows the members to have any shape connected in any stable configuration, trusses typically comprise five or more triangular units constructed with straight members whose ends are connected at joints referred to as nodes.
