## Abstracts

Cryoablation catheters are used in procedures where tissue destruction needs to be performed, such as tumor ablation and the treatment of cardiac arrhythmias. They consist of a hollow lumen through which one or more electrodes can pass. A liquid coolant is circulated throughout this tube for cooling purposes with the electrode tip being brought into contact with body tissues via a thermal-sensitive sheath. This facilitates cryogenic necrosis by focused application of low temperatures at specific sites within the heart muscle that have been mapped out before any surgical procedure.
