Abstracts

Tumor-specific Antigen is a new Antigen that is expressed on the surface of certain Tumor cells but not on normal cells. Such antigens may be present in tumors of the same tissue type in different individuals. Tumor-specific antigens help the body develop an immune response to cancer cells. They could be used as potential targets for targeted therapy or immunotherapy to help improve the body's immune system to kill more cancer cells. Tumor-specific antigens can also be used in laboratory tests to help identify certain types of cancer.
