Abstracts

Turbidity Curtains are constructed using floatation at the top to suspend the turbidity curtain in the water. Skirts are attached below the floatation and serve as the barrier to control the silt and sediment. Tension cables are used on heavier duty turbidity curtains to provide strength. Ballast chains provide strength as well as weight to keep the skirts oriented as close to vertical as conditions allow. There are several different configurations available based on how curtains will be connected end-to-end to provide longer spans, ranging from grommets only to universal aluminum connectors.
