Abstracts

Aluminum alloy is used as the inner liner of the hydrogen bottle for heat preservation, and the outer layer is covered with carbon fiber of about 3cm thickness to improve the structural strength of the hydrogen bottle and reduce the overall mass as much as possible. Several groups of hydrogen bottles are connected in series by a long and thin pipe at the valve of hydrogen bottle, and monitoring equipment such as temperature sensor is added. In terms of safety, when the temperature sensor senses that the outside temperature is much higher than the normal temperature (generally more than 100°C), it will automatically open the valve to quickly release all the gas in the bottle.
