Abstracts

Ultra-pasteurized creams are subject to an ultra-high temperature (UHT) pasteurization process where they are heated to at least 275°F for a very short period of time. Ultra pasteurized dairy products (the process is used for many products, including juices, etc.) have a much longer shelf life than their pasteurized counterparts because the process eliminates a much larger percentage of bacteria than regular pasteurization does.

This report contains market size and forecasts of Ultra-pasteurized Cream in China, including the following market information:
