Abstracts

Ultra-pasteurized double cream is a type of pasteurized milk. It is a commercial milk that is directly supplied to consumers after centrifugation, standardization, homogenization, sterilization, cooling and filling. The purpose of ultra-pasteurization is to prolong the shelf life of the product. The sterilization temperature and time are different from those of ordinary pasteurized milk, and the transportation and storage liquid after filling and filling are different. Ultra-pasteurized double cream minimizes product recontamination during processing and packaging. This requires extremely high production hygiene and an excellent cold chain distribution system. Generally, the lower the cold chain temperature, the longer the product shelf life, and the maximum temperature should not exceed 7 °C.
