## Abstracts

In an ultrasonic cleaning system, the device that provides the electrical energy to power the ultrasonic transducers is known as the ultrasonic “generator.” Basically, the ultrasonic generator converts electrical energy received from the power line into electrical energy with the proper frequency, voltage and amperage to power or “drive” the ultrasonic transducers. In most cases, the power line provides “Alternating Current” or AC at a voltage of 100 to 250 Volts and at a frequency of 50 or 60 Hz depending on location. The power requirements for driving ultrasonic transducers vary but, in general, the ultrasonic generator needs to provide the transducer with a signal at the frequency of intended operation and (usually) at a voltage significantly higher than that delivered from the power line.

Ultrasonic generators today are “smart.” They are often able to obtain feedback from the transducers which allows them to adjust frequency and power output to maintain maximum ultrasonic cleaning effect. Ultrasonic generators also have the ability to provide customized variations in waveform to maximize the ultrasonic cleaning effect while minimizing the possibility of damage to the parts being cleaned.

In addition to ultrasonic cleaning, ultrasonic generator can also be used in a variety of medical devices such as scalpels and dental tools. This is the report's statistic scope.
