Abstracts

Untempered steel is based on medium carbon manganese steel with vanadium, titanium and niobium micro-alloying elements, so that it can be dissolved in austenite during heating. The solubility decreases with cooling. The microalloying elements vanadium, titanium, and niobium will be precipitated in the form of fine carbides and nitrides in the ferrite and pearlite that are precipitated first. These precipitates maintain a coherent relationship with the parent phase and strengthen the steel. Untempered steel for cold forging can save annealing and quenching and tempering, and has high strength, which not only improves performance but also saves energy.
